                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present invention relates to a neural thread protein (NTP) peptide referred to as cell death peptide. Thought to be cytostatic, antibacterial, immunosuppressive and antiinflammatory. It is useful for treating a condition in a patient requiring removal or destruction of cells, for treating a condition such as benign or malignant tumor, inflammatory disease, autoimmune disease and infectious disease. The peptide useful for treatment is derived from the amino acid sequence for a pancreatic thread protein. The peptide is conjugated, linked or bound to a molecule chosen from antibody or its fragment, antibody-like binding molecule, where the molecule has a higher affinity for binding to a tumor or other target than binding to other cells. Treatment using NTP peptides can remove benign tumors with less risk and fewer of the undesirable side effects of surgery. The present sequence is an NTP encoding sequence
                                                                                                                                                                                                                                                                                                                                  NTP

Disclosure; Page 16; 77pp; English.

The present invention relates to a neural thread protein (NTP) peptide referred to as cell death peptide. Thought to be cytostatic, antibacterial, immunosuppressive and antiinflammatory. It is useful for treating a condition in a patient requiring removal or destruction of cells, for treating a condition such as benign or malignant tumor, inflammatory disease, autoimmune disease and infectious disease. The peptide useful for treatment is derived from the amino acid sequence for a pancreatic thread protein. The peptide is conjugated, linked or bound to a molecule chosen from antibody or its fragment, antibody-like binding molecule, where the molecule has a higher affinity for binding to a tumor or other target than binding to other cells. Treatment using NTP peptides can remove benign tumors with less risk and fewer of the undesirable side effects of surgery. The present sequence is an NTP encoding sequence

                                                                                                                                                                                               The present invention provides the protein and coding sequences of number of human digestive system antigens. These can be used in the diagnosis, treatment and prevention of digestive system disorders, including cancer, Meckel's diverticulum, bacterial or parasitic infections, appendicitis, Hirschsprung's disease, chronic colitis ulcerative colitis. The present sequence is a genomic DNA fragment encoding a digestive system antigen of the invention

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 sequences AAS31827-AAS32182 represent genomic DNA molecules, which enco the liver associated polypeptides of the invention. Liver associated polypeptides are useful in the polypeptides and their associated polypucteotides are useful in the diagnosis, treatment and prevention of various types of disorders in ediagnosis, treatment and prevention of various types of disorders in ediagnosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Isolated nucleic acid molecule encoding a human liver related protein is used in preventing, treating or ameliorating disorders of the liver particularly cancer of the liver.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    17-NOV-2000;

CC plynucleotides, antibodies against human liver antigens, and the use of
CC liver antigen polynucleotides and polypeptides in diagnosing, treating,
CC prognosing or preventing various disorders of the liver. Such conditions
CC include viral infections (e.g., cytomegalovirus, Epstein-Barr virus,
CC infections (e.g., Clonorchis sinensis, Echinococcus granulosus and
CC Entamoeba histolytica), and also bacterial and fungal infections. Other
CC cirrhosis and granulomatous hepatitis), damage caused by drugs or toxins,
CC autoimmune diseases (e.g., Wilson's disease, primary biliary cirrhosis),
CC accinnoma), portal hypertension, or gastrointestinal disorders (e.g.,
CC peptic ulcers, gastritis and peritoneal diseases). Liver antigen
CC polypeptides and polynucleotides may also be used in screening for
CC compounds which modulate liver antigen expression or activity. The
CC polynucleotides may be used for gene therapy, chromosome mapping,
CC in the identification of individuals and in forensic analysis, and the
CC equences Newsons bused as molecular weight markers or to prepare
CC sequences Newsons bused as molecular weight markers or to prepare
CC sequences Newsons and the sequence data for this patent did not form part of
CC the printed specification, but was obtained in electronic format directly
CC from the USPTO at sequence captors obtained in electronic format directly
CC from the USPTO at sequence sequence of the printed format directly
CC from the USPTO at sequence sequence of the printed specification of the sequence of the printed security of the sequence of the printed specification of the sequence of the sequence

The methods are useful for identifying an eRNA or DNA for modifying a genetic network in cell to alter the cells phenotype. The present sequence represents human oligonucleotide sequence enquiry.

Accordingly, it provides methods for detecting such mutants, as well as identifying and screening for cytostatic compounds useful for treating or preventing cancers associated with a BRCA1 genetic variant. This polynucleotide is a mutant human BRCA1 genomic DNA fragment that arrises as a result of a recombination event (deletion 5), which causes the omission of exons 15 and 16, given in an exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  This invention relates to a novel method for predicting a predispositi to cancer in a patient by detecting large deletions in the human tumou suppressor gene identified as the breast cancer susceptibility gene 1 (BRCA1). Specifically, it refers to deletions that result from the unequal crossover between a pair of repetitive Alu sequences in the gene, such that the recombined nucleotide sequence containing the deletion indicates a predisposition to breast and ovarian cancer. The
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Predicting a predisposition to cancer in a patient comprising detecting deletion in the BRCA1 gene that results from the unequal crossover between a pair of repetitive sequences in the BRCA1 gene.
                                                                                                                                                                                                                                          07-JUN-2002;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            This invention relates to a novel method for predicting a predisposition to cancer in a patient by detecting large deletions in the human tumour suppressor gene identified as the breast cancer susceptibility gene 1 (BRCA1). Specifically, it refers to deletions that result from the unequal crossover between a pair of repetitive Alu sequences in the BRCA1 gene, such that the recombined nucleotide sequence containing the deletion indicates a predisposition to breast and ovarian cancer. The present invention describes newly discovered deletion mutations that are
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     believed to be deleterious and cause significant alterations in the structure or biochemical function of BRCA1. Accordingly, it provides methods for detecting such mutants, as well as identifying and screening for cytostatic compounds useful for treating or preventing cancers associated with a BRCA1 genetic variant. This polynucleotide is a human BRCA1 DNA fragment representing the region downstream of the deletion 5 recombination event that causes the omission of exons 15 and 16, given in an exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Disclosure; Fig

amino acid sequences given in AAM82170 to AAM91921. (I) have cytostatic activity, and can be used in gene therapy and vaccine production. (I) proteins and polynucleotides may be used in the prevention, diagnosis and treatment of diseases associated with inappropriate (I) expression. For example, they may be used to treat disorders associated with decreased expression by rectifying mutations or deletions in a patient's genome that affect the activity of (I) by expressing inactive proteins or to supplement the patients own production of (I). Additionally, (I) polynucleotides may be used to produce the secreted (I), by inserting the nucleic acids into a host cell and culturing the cell to express the protein. (I) proteins and polynucleotides may be used to prevent, diagnose and treat immune/haematopoietic-related diseases, especially
                                                                                                                                                                                                                                                                             AAK54951 to AAK64702 encode the human immune/haematopoietic antigen amino acid sequences given in AAM82170 to AAM91921. (I) have cytosta
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           2000US-0246528P

                                                                                                                                                                 AAKS4951 to AAK64702 encode the human immune/haematopoietic antigen (I) CC amino acid sequences given in AAM82170 to AAM91921. (I) have cytostatic CC activity, and can be used in gene therapy and vaccine production. (I) CC proteins and polynucleotides may be used in the prevention, diagnosis and CC treatment of diseases associated with inappropriate (I) expression. For CC example, they may be used to treat disorders associated with decreased CC expression by rectifying mutations or deletions in a patient's genome CC supplement the activity of (I) by expressing inactive proteins or to CC supplement the patients own production of (I). Additionally, (I) CC supplement the patients own production of (I). Additionally, (I) CC diagnose and treat immune/haematopoietic acids into a host cell and culturing the cell to express the CC protein. (I) proteins and polynucleotides may be used to prevent, CC diagnose and treat immune/haematopoietic-derived cells. AAK64703 CC cancers and cancer metastases of haematopoietic antigen genomic CC sequences from the present invention. AAK54942 to AAK54950 and AAM82169 crepresent sequences used in the exemplification of the present invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                     문
                                                                                                                                                                                                                                                                                                                                      8
                                                                                                                                                                                                                                                                                                                                                                                                                                                           antino acid sequences given in AAMS170 to AAMS1921. (I) have cytostatic activity, and can be used in gene therapy and vaccine production. (I) concerns and polynucleotides may be used in the prevention, diagnosis and treatment of diseases associated with inappropriate (I) expression. For example, they may be used to treat disorders associated with decreased expression by rectifying mutations or deletions in a patient's genome that affect the activity of (I) by expressing inactive proteins or to supplement the patients own production of (I). Additionally, (I) collections into a host cell and culturing the cell to express the concept and treat immune/haematopoietic may be used to prevent, and cancers and cancer metastases of haematopoietic actived cells. AAK64703 conners and cancer metastases of haematopoietic actived cells. AAK64703 conners from the present invention. AAK54942 to AAK54950 and AAM82169 crepresent sequences used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                    Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  This invention relates to a novel method for predicting a predisposition to cancer in a patient by detecting large delections in the human tumour suppressor gene identified as the breast cancer susceptibility gene 1 (BRCA1). Specifically, it refers to deletions that result from the unequal crossover between a pair of repetitive Alu sequences in the BRCA1 gene, such that the recombined nucleotide sequence containing the
                                                                                                                                                                            Open reading frame detection; genome sequencing; colon cancer; breast cancer; population genome analysis; genetic shift; cancer; antibiotic resistance; antibiotic non-tolerance; congenital disease; agriculture; food crop genome; resistance gene; retrovirus; influenza virus; eukaryotic pathogen detection; trypanosome; Plasmodium;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   present invention describes newly discovered deletion mutations that are believed to be deleterious and cause significant alterations in the structure or biochemical function of BRCA1. Accordingly, it provides methods for detecting such mutants, as well as identifying and screening for cytostatic compounds useful for treating or preventing cancers associated with a BRCA1 genetic variant. This polynucleotide is a mutant human BRCA1 genomic DNA fragment that arrises as a result of a recombination event (deletion 3), which causes the omission of exons 16 and 17, given in an exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Predicting a predisposition to cancer in a patient comprising detecting deletion in the BRCA1 gene that results from the unequal crossover between a pair of repetitive sequences in the BRCA1 gene.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 07-JUN-2002; 2002US-0387132P

                                                                                                                                                                                                                                                                                                                     밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention describes a method of determining open reading frames in CC the genome of organism, comprising contacting mRNA from cell of organism CC with a single oligonucleotide primer (I) at low stringency, preparing CC single-stranded cDNA by reverse transcribing mRNA with (I), amplifying CC cDNA, sequencing the product, and repeating the contacting, preparing CC and amplifying steps with different primers and sequencing resulting nucleic acids. The method is useful for: determining that a known CC nucleotide sequence from a genome of an organism corresponds to a CC nucleotide sequence from a genome of an organism corresponds to a CC nucleotide sequence of an open reading frame; for preparing a contig, CC all or part of a genome of an organism. and for sequencing CC all or part of subjects and can be used to carry out genetic analyses of CC long cancer or breast cancer cell. The method is useful for analyses of CC populations of subjects and can be used to carry out genetic analyses of CC populations of subjects and can be used to study living CC systems to determine if, e.g. there have been genetic shifts which render CC an individual or population more or less likely to be afflicted with CC diseases such as cancer, to determine antibiotic resistance or non-CC tolerance, and so forth. The method can also be used in the study of CC congenital diseases, and the risk of affliction to a foetus, as well as the study of whether the conditions are likely to be passed to offspring CC carried out in all animals, plants, birds, fish, etc. Using this method, in the area of agriculture, for example the genomes of food crops can be considered to determine if resistance genes are present, defects in plant CC determination of the pathogens which integrate into the genome, such as constant of the pathogens which integrate into the genome, such as constant of the pathogens within the pathogens with a fifteen into the genome, such as constant of the pathogens with the constant of the pathogens within the constant of the pat
                                                                                                                                                                                                                                                                                                                                                                                                            Best Local Similarity Matches 57; Conserv
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     (SIMP/)

This method is also applied to the astropens, such as trypanosomes, different types of plasmodium, etc. The method essentially eliminates sequencing of non-coding portions. This sequence represents a polynucleotide isolated from human colon cancer cell cDNA library

                                                                                                                                                                                                                                                                                                                                                  ş
                                                                                                                                                                                                                                                                                                                                                                                   Matches
                                                                                                                                                                                                                                                                                                                                                                                                               Query Match
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            referred to as cell death peptide. Thought to be cytostatic, antibacterial, immunosuppressive and antiinflammatory. It is useful for treating a condition in a patient requiring removal or destruction of cells, for treating a condition such as benign or malignant tumor, inflammatory disease, autoimmune disease and infectious disease. The peptide useful for treatment is derived from the amino acid sequence for a pancreatic thread protein. The peptide is conjugated, linked or bound to a molecule chosen from antibody or its fragment, antibody-like binding molecule, where the molecule has a higher affinity for binding to a tumor or other target than binding to other cells. Treatment using NTP peptides can remove benign tumors with less risk and fewer of the undesirable side
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               19-JUL-2001; 2001US-0306150P.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present invention relates to identifying an eRNA or a DNA sequence comprising an eRNA-encoding sequence in the nucleome of a eukaryotic cell comprises identifying non-protein-encoding nucleotide sequences within an mRNA transcript or a DNA sequence encoding same in the nucleome. The methods are useful for identifying an eRNA or DNA for modifying a genetic network in cell to alter the cells phenotype. The present sequence represents human oligonucleotide sequence enquiry.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Identifying sequence in

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present invention describes a set of regulatory single nucleotide CC polymorphism (SNP) polynucleotides or its complementary set of contiguous CC polynucleotides comprising polynucleotides of at least 6 contiguous CC nucleotides contains a regulatory SNP with 5' and/or 3' genomic flanking sequence. A set of regulatory SNP polynucleotides contains several regulatory SNP swhich collectively map CC polynucleotides contains several regulatory SNP swhich collectively map CC to several transcription factor binding site cluster (TFC) sequences so CC that each SNP lies within a TFC sequence, and a genomic nucleic acid contains a complementary except for the SNP, to a portion of a genomic CC identical or complementary except for the SNP, to a portion of a genomic CC regulatory SNP polynucleotides 3' to the CC regulatory SNP polynucleotides can be used in CC gene therapy. The regulatory SNP polynucleotides can be used in CC regulatory systems for finding new drugs, or for treating or CC polynucleotides are also useful as probes or primers for detecting the regulatory SNPs. The present sequence represents a human genome related CC polynucleotides comprising a SNP, which is used in an example from the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               This invention relates to a novel method for predicting a predisposition to cancer in a patient by detecting large deletions in the human tumour suppressor gene identified as the breast cancer susceptibility gene 1 (BRCA1). Specifically, it refers to deletions that result from the unequal crossover between a pair of repetitive Alu sequences in the BRCA1 gene, such that the recombined nucleotide sequence containing the deletion indicates a predisposition to breast and ovarian cancer. The present invention describes newly discovered deletion mutations that are bedistred to be deletion mutations describes newly discovered deletion mutations that are
                           AAI73060 to AAI79867 represent isolated human polymorphic polynucleotide sequences (I), which contain single nucleotide polymorphisms (SNPs).

AAM53114 to AAM53329 represent peptides related to human polymorphic polynucleotide sequences. The sequences can be used in gene and protein therapy, and in vaccine production. (I) and the polypeptides encoded by them may be used in the prevention, diagnosis and treatment of diseases associated with inappropriate expression of polymorphic polypeptides. For example, (I) may be used to treat disorders by rectifying mutations or

Accordingly, it provides methods for detecting such mutants, as well as identifying and screening for cycostatic compounds useful for treating or preventing cancers associated with a BRCA1 genetic variant. This polynucleotide is a mutant human BRCA1 genomic DNA fragment that arrises as a polynucleotide in a mutant recombination event (deletion 5), which causes the omission of exons 15 and 16, given in an exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                                            Claim 1; Page 2557; 2653pp; English

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        by expressing inactive proteins or to supplement the patients own production of polypeptide. Additionally, (1) and its complementary sequences may also be used as DNA probes in diagnostic assays to detect and quantitate the presence of similar nucleic acids in samples, and therefore which patients may be in need of restorative therapy. The polypeptides encoded by (1) may be used as antigens in the production of antibodies specific for polymorphic polypeptides. The antibodies may also be used to down regulate expression and activity. The antibodies may also
                                           The present invention relates to identifying an eRNA or a DNA sequence comprising an eRNA-encoding sequence in the nucleome of a eukaryotic cell comprises identifying non-protein-encoding nucleotide sequences within an mRNA transcript or a DNA sequence encoding same in the nucleome. The methods are useful for identifying an eRNA or DNA for modifying a genetic network in cell to alter the cells phenotype. The present sequence

CE silent SNPs. Sequences 1113 to 1192 (AAA77430-A77509) are consecutive CC pairs of nucleotides containing SNPs which result in changes in the CC corresponding maino acid sequences (ABA17439-B11828). The SNPs in CC sequences 1113 to 1128 (AAA77430-A77445) lead to conservative amino acid changes, while those in sequences 1129 to 1186 (AAA77446-A77503) result CC in non- conservative changes. The SNPs in sequences 1187 to 1192 (C (AAA77504-A77509) generate frameshift mutations. The invention also CC relates to a method of detecting a polymorphic site in a nucleic acid and CC a method of detecting polymorphic site in a nucleic acid and CC against such peptides containing polymorphic sites, antibodies raised CC gene therapy of an individual having, suspected of having, or at risk of CC gene therapy of an individual having, suspected of having, or at risk of CC gene therapy of an individual having, suspected of having, or at risk of CC gene therapy of the condition due to the presence of a sequence CC polymorphism. Such treatment would comprise administration of the wild-cype nucleic acid sequence. Antibodies raised against polymorphic CC type nucleic acid sequence. Antibodies raised against polymorphic

                                                                                                                                                                       CC Equences (1), which contain single nucleotide polymorphic polymorphic CC AAM53114 to AAM5329 represent peptides related to human polymorphic CC polymucleotide sequences. The sequences can be used in gene and protein CC therapy, and in vaccine production. (I) and the polymeptides encoded by the may be used in the prevention, diagnosis and treatment of diseases cc associated with inappropriate expression of polymorphic polypeptides. For CC deletions in a patient's genome that affect the activity of polypeptides by expressing inactive proteins or to supplement the patients own CC gequences may also be used as DNA probes in diagnostic assays to detect and quantitate the presence of similar nucleic acids in samples, and CC therefore which patients may be used as antigens in the production of polypeptides encoded by (I) may be used as antigens in the production of polypeptides encoded by (I) may be used as antigens in the production of be used to down regulate expression and activity. The antibodies may also be used as diagnostic agents for detecting the presence of polypeptides.

                                                                                                                                                                                                                                ঠ
                                                                                                                                                                                                                                                                                                                                                                              CC AAI73060 to AAI79867 represent isolated human polymorphic polynucleotide CC GAM53114 to AAM53129 represent peptides related to human polymorphic (SNPs). CC AAM53114 to AAM53129 represent peptides related to human polymorphic CC polynucleotide sequences. The sequences can be used in gene and protein CC therapy, and in vaccine production. (I) and the polypeptides encoded by CC them may be used in the prevention, diagnosis and treatment of diseases CC associated with inappropriate expression of polymorphic polypeptides. For CC deletions in a patient's genome that affect the activity of polypeptides or CC deletions in a patient's genome that affect the patients own CC production of polypeptide. Additionally, (I) and its complementary CC sequences may also be used as DNA probes in diagnostic assays to detect CC and quantitate the presence of similar nucleic acids in samples, and CC polypeptides encoded by (I) may be used as antigens in the production of colypeptides encoded by (I) may be used as antigens in the production of CC be used to down regulate expression and activity. The antibodies may also be used as diagnostic agents for detecting the presence of polymorphic.
                                                                                                                                                                                                                                                                   Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      CC AAI73060 to AAI79867 represent isolated human polymorphic polynucleotide CC sequences (I), which contain single nucleotide polymorphisms (SNPs). CC AAM53114 to AAAM53129 represent peptides related to human polymorphic CC AAM53114 to AAAM53129 represent peptides related to human polymorphic CC polynucleotide sequences. The sequences can be used in gene and protein CC therapy, and in vaccine production. (I) and the polypeptides encoded by them may be used in the prevention, diagnosis and treatment of diseases CC associated with inappropriate expression of polymorphic polypeptides. For CC example, (I) may be used to treat discorders by rectifying mutations or CC example, (I) may be used to treat discorders by rectifying mutations or CC production in a patient's genome that affect the activity of polypeptides by expressing inactive proteins or to supplement the patients own CC production of polypeptide. Additionally, (I) and its complementary CC sequences may also be used as DNA probes in diagnostic assays to detect CC and quantitate the presence of similar nucleic acids in samples, and CC therefore which patients may be in need of restorative therapy. The CC sequences may also be used as antigens in the production of antibodies may also be used as detection of antibodies may also be used as detection the antibodies may also be used as detection the antibodies may also be used as detection the presence of polymorphic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Matches

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   This invention relates to a novel method for predicting a predisposition to cancer in a patient by detecting large deletions in the human tumour suppressor gene identified as the breast cancer susceptibility gene 1 (BRCA1). Specifically, it refers to deletions that result from the unequal crossover between a pair of repetitive Alu sequences in the BRCA1 gene, such that the recombined nucleotide sequence containing the deletion indicates a predisposition to breast and ovarian cancer. The
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             07-JUN-2002; 2002US-0387132P.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                18-DEC-2003
                                                                                                                                                                          Human; single nucleotide polymorphism; SNP; genome; gene therapy; protein therapy; vaccine; probe; diagnostic assay; detection; quantitation; restorative therapy; polymorphic; ds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               methods for detecting such mutants, as well as identifying and screening for cytostatic compounds useful for treating or preventing cancers associated with a BRCA1 genetic variant. This polynucleotide is a mutant human BRCA1 genomic DNA fragment that arises as a result of a recombination event (deletion 3), which causes the omission of exons 16 and 17, given in an exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  present invention describes newly discovered deletion mutations that are believed to be deleterious and cause significant alterations in the structure or biochemical function of BRCAL Accordingly, it provides

CC sequences (1), which contain single nucleotide polymorphisms (SNPs).

CC AAM53114 to AAM53329 represent peptides related to human polymorphic CC polymucleotide sequences. The sequences can be used in gene and protein CC therapy, and in vaccine production. (1) and the polymorphise secondary, and in vaccine production, diagnosis and treatment of diseases CC associated with inappropriate expression of polymorphic polymorphic contents or contents in a patient's genome that affect the activity of polypoptides. For CC example, (1) may be used to treat disorders by rectifying mutations or conduction in a patient's genome that affect the activity of polypoptides by expressing inactive proteins or to supplement the patients own CC production of polypoptide. Additionally, (1) and its complementary CC sequences may also be used as DNA probes in diagnostic assays to detect and quantitate the presence of similar nucleic acids in samples, and CC therefore which patients may be in need of restorative therapy. The CC antibodies specific for polymorphic polypoptides. The antibodies may also be used as antigens in the production of construction of constructions of construction of constructions of construction of constructions of constructions

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            by expressing inactive proteins or to supplement the patients own production of polypeptide. Additionally, (I) and its complementary sequences may also be used as DNA probes in diagnostic assays to detect and quantitate the presence of similar nucleic acids in samples, and therefore which patients may be in need of restorative therapy. The polypeptides encoded by (I) may be used as antigens in the production of antibodies specific for polymorphic polypeptides. The antibodies may also be used as diagnostic agents for detecting the presence of polymorphic be used as diagnostic agents for detecting the presence of polymorphic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             therapy, and in vaccine production. (I) and the polypeptides encoded by them may be used in the prevention, diagnosis and treatment of diseases associated with inappropriate expression of polymorphic polypeptides. For example, (I) may be used to treat disorders by rectifying mutations or deletions in a patient's genome that affect the activity of polypeptides between in a patient's genome that affect the activity of polypeptides
                                                                                                                                                                                                                                                                                                                                          Homo sapiens

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              relates to a method of detecting a polymorphic site in a nucleic acid and a method of determining the relatedness of two nucleic acids. It also encompasses peptides containing polymorphic sites, antibodies raised against such peptides, and a method of detecting polymorphic proteins/peptides using the antibodies. The nucleic acids are useful for gene therapy of an individual having, suspected of having, or at risk of developing a pathological condition due to the presence of a sequence polymorphism. Such treatment would comprise administration of the wild-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Sequences AAA76318-A77509 represent 1192 human nucleic acid sequences which contain single nucleotide polymorphisms (SNPs). Sequences 1 to 1 (AAA76318-A77499) are consecutive pairs of nucleotides which contain silent SNPs. Sequences 1113 to 1192 (AAA77430-A77509) are consecutive pairs of nucleotides containing SNPs which result in changes in the corresponding amino acid sequences (AAB11749-B11828). The SNPs in sequences 1113 to 1128 (AAA77430-A77445) lead to conservative amino ac

CC AAM53114 to AAM53329 represent peptides related to human polymorphic polymucleotide sequences. The sequences can be used in gene and protein CC therapy, and in vaccine production. (I) and the polymorphic server, and in vaccine production, diagnosis and treatment of diseases CC associated with inappropriate expression of polymorphic polymoptides. For CC example, (I) may be used to treat disorders by rectifying mutations or CC example, (I) may be used to treat disorders by rectifying mutations or CC example, (I) may be used to supplement the patients own CC polymorphic proteins or to supplement the patients own CC production of polypeptide. Additionally, (I) and its complementary CC sequences may also be used as DNA probes in diagnostic assays to detect and quantitate the presence of similar nucleic acids in samples, and CC polypeptides encoded by (I) may be used of restorative therapy. The CC polypeptides encoded by (I) may be used as antigens in the production of CC polypeptides encoded by (I) may be used as antigens in the production of Detect and as propertides. The antibodies may also be used as diagnostic agents for detecting the presence of polymorphic polymorphic polymorphic polymorphic agents for detecting the presence of polymorphic p
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Matches 48;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Sequence 51
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Human; single nucleotide polymorphism; SNP; genome; gene therapy; protein therapy; vaccine; probe; diagnostic assay; detection; quantitation; restorative therapy; polymorphic; ds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           AAI78078 standard; DNA;
AAI73060 to AAI79867 represent isolated human polymorphic polynucleotide sequences (I), which contain single nucleotide polymorphisms (SNPs). AAM53114 to AAM53329 represent peptides related to human polymorphic polynucleotide sequences. The sequences can be used in gene and protein therapy, and in vaccine production. (I) and the polypeptides encoded by them may be used in the prevention, diagnosis and treatment of diseases
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Human silent SNP containing nucleic acid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    09-NOV-2001

associated with inappropriate expression

of polymorphic

polypeptides.

sequences (1), which contain single nucleotide polymorphisms (SNPs).

AAM53114 to AAM53329 represent peptides related to human polymorphic polymucleotide sequences. The sequences can be used in gene and protein therapy, and in vaccine production. (I) and the polypeptides encoded by them may be used in the prevention, diagnosis and treatment of diseases associated with inappropriate expression of polymorphic polypeptides. For example, (I) may be used to treat disorders by rectifying mutations or deletions in a patient's genome that affect the activity of polypeptides by expressing inactive proteins or to supplement the patients own production of polypeptide. Additionally, (I) and its complementary sequences may also be used as DNA probes in diagnostic assays to detect and quantitate the presence of similar nucleic acids in samples, and

For

AAI73060 to AAI79867 represent isolated human polymorphic polynucleotide

Additionally, (1) and its complementary sequences may also be used as DNA probes in diagnostic assays to detect and quantitate the presence of similar nucleic acids in samples, and therefore which patients may be in need of restorative therapy. The polypeptides encoded by (1) may be used as antigens in the production of antibodies specific for polymorphic polypeptides. The antibodies may also be used to down regulate expression and activity. The antibodies may also be used as diagnostic agents for detecting the presence of polymorphic polypeptides in samples
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Human, single nucleotide polymorphism; SNP; genome; gene therapy; protein therapy; vaccine; probe; diagnostic assay; detection;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Human nonconservative amino acid changing

                   CC AAI73060 to AAI79867 represent isolated human polymorphic polynucleotide CC sequences (I), which contain single nucleotide polymorphisms (SNPs). CC AAM53114 to AAM53129 represent peptides related to human polymorphic CC polynucleotide sequences. The sequences can be used in gene and protein CC thermapy, and in vaccine production. (I) and the polypeptides encoded by C them may be used in the prevention, diagnosis and treatment of diseases CC associated with inappropriate expression of polymorphic polypeptides. For CC deletions in a patient's genome that affect the activity of polypeptides or CC deletions in a patient's genome that affect the patients own CC by expressing inactive proteins or to supplement the patients own CC sequences may also be used as NAM probes in diagnostic assays to detect CC and quantitate the presence of similar nucleic acids in samples, and CC therefore which patients may be in need of restorative therapy. The CC service which patients may be in need of restorative therapy. The CC contibodies medically (I) may be used as antigens in the production of CC polypeptides encoded by (I) may be used as antigens in the production of CC contibodies may be in need of restorative therapy. The CC contibodies may also be used as diagnostic agents for detecting the presence of polymorphic continues of polymorphic and activity. The antibodies may also be used as diagnostic agents for detecting the presence of polymorphic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    therefore which patients may be in need of restorative therapy. The polypeptides encoded by (I) may be used as antigens in the production of antibodies specific for polymorphic polypeptides. The antibodies may also be used to down regulate expression and activity. The antibodies may also be used as diagnostic agents for detecting the presence of polymorphic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Claim 1;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Ş
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              SS X
                                                                                AAI73060 to AAI79867 represent isolated human polymorphic polynucleotide sequences (I), which contain single nucleotide polymorphisms (SNPB).

AAM53114 to AAM5329 represent peptides related to human polymorphic polymorphic polynucleotide sequences. The sequences can be used in gene and protein therapy, and in vaccine production. (I) and the polypeptides encoded by them may be used in the prevention, diagnosis and treatment of diseases associated with inappropriate expression of polymorphic polypeptides. For example, (I) may be used to treat disorders by rectifying mutations or deletions in a patient's genome that affect the activity of polypeptides by expressing inactive proteins or to supplement the patients own production of polypeptide. Additionally, (I) and its complementary sequences may also be used as DAB probes in diagnostic assays to detect and quantitate the presence of similar nucleic acids in samples, and therefore which patients may be used as antigens in the production of polypeptides encoded by (I) may be used as antigens in the production of be used to down regulate expression and activity. The antibodies may also be used as diagnostic aspants for detecting the presence of polymorphic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Query Match

                                                                                                                                                     This invention relates to a novel isolated protein which comprises a human mannosyl transferase having the same sequence as the fully defined 611- or 255-amino acid sequence or its fragment. The invention may be useful for the production of compounds with an antimanic or antidepressant activity whilst the disclosed sequences may be used for gene therapy. The invention also provides a human mannosyl transferase fusion protein and a chromosome 9 fusion protein, both of which result from a chromosome 11 translocation. The human mannosyl transferase and the fusion proteins are useful for diagnosing or predicting the susceptibility to a bipolar disorder and for identifying a compound that modulates the activity of a mannosyl transferase. The present sequence is that of a region of human DNA surrounding a single nucleotide polymorphism within the gene which encodes the human mannosyl transferase of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        06-MAY-2004 (first entry)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     variation

This invention relates to novel tissue specific genes and gene clusters cand the proteins encoded by them. The invention includes the 1922 immune CC gene complex, such as TMD0024 (XM 0 60945), TMD1779 (XM 0 60946), TMD0884 (CC (XM 0 60946), TMD00825 (XM 0 60946), TMD1781 (XM 0 80942), TMD0304 (XM 0 60956), TMD0888 (XM 0 89422), TMD0781 (XM 0 60959), bone marrow specific genes consisting essentially of XM 0 62147 (CC and XM 0 61676 or their proteins, kidney specific genes TMD0049 (XM 0 62147 (CC and XM 0 61676 or their proteins, kidney specific genes TMD0039 (XM 0 87351), TMD0190 (XM 0 87157), TMD0242 (XM 0 88369), TMD0335 (XM 0 89960), CC TMD0371, TMD0374, TMD0469 (XM 0 88369), TMD0733, TMD0374, TMD0466 (XM 0 88369), TMD0733, TMD01114 (XM 0 89960), CC 19841) and TMD1148 (XM 0 87108), pancreas specific genes consisting cessentially of TMD0285, TMD0275, TMD0275, TMD0277, TMD0233, TMD0275, TMD0275, TMD0275, TMD0277, TMD0233, TMD0233, TMD0258, TMD0258, TMD0274, TMD0677, TMD0233, TMD0258, TMD0258, TMD0274, TMD0677, TMD0273, TMD0733, TMD0111, and TMD1127 or its encoded polypeptide or the 11q12.2 spleen gene complex, comprising CC TMD0621 (XM 1 66853), TMD10793 (XM 1 66854), TMD1028 (XM 1 66855) and CC TMD0621 (XM 1 66853), TMD01028 (XM 1 66854), TMD1028 (XM 1 66855) and CC CMD0011ds with an immunostimulant, cytostatic, osteopathic, nephrotropic, antidiabetic, ophthalmological or antianaemic activity. The sequences of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                16-APR-2002; 2002US-0372669P.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  the invention may also be useful for gene therapy. The genes and proteins of the invention are useful for modulating the maturation of an immune system cell, kidney cell, pancreas cell, retinal cell, spleen cell or reticuloendothelial cell, modulating interactions between lymphoid and non-lymphoid immune system cells, as molecular markers, as drug targets, assessing kidney, pancreas or spleen function and for detecting, diagnosing, staging, monitoring, prognosticating, preventing or treating diseases and conditions associated with genes of the bone marrow, kidney, spleen, pancreas, retina, spleen or lymphoid disease (for example neutropenia, leucopenia, cancer, multiple myeloma, renal failure, glaucoma or anaemia. The present sequence is that of a human tissue-specific gene promoter DNA sequence which is related to the invention.
AAI73060 to AAI79867 represent isolated human polymorphic polynucleotide sequences (I), which contain single nucleotide polymorphisms (SNPs).

AAM53114 to AAM53329 represent peptides related to human polymorphic polymucleotide sequences. The sequences can be used in gene and protein therapy, and in vaccine production. (I) and the polypeptides encoded by them may be used in the prevention, diagnosis and treatment of diseases associated with inappropriate expression of polymorphic polypeptides. For example, (I) may be used to treat disorders by rectifying mutations or deletions in a patient's genome that affect the activity of polypeptides by expressing inactive proteins or to supplement the patients own production of polypeptide. Additionally, (I) and its complementary sequences may also be used as DNA probes in diagnostic assays to detect
                                                                                                                                                                                                                                                                                                                                                                                                                     Claim 1;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  WPI; 2001-356160/37
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     30-NOV-1999; 99US-0168138P.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Ś
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              នននិន្ននិង
                             CC AAI73366 to AAI79867 represent isolated human polymorphic polynucleotide CC sequences (I), which contain single nucleotide polymorphisms (SNPs). CC AAM53114 to AAM53329 represent peptides related to human polymorphic CC polynucleotide sequences. The sequences can be used in gene and protein CC therapy, and in vaccine production. (I) and the polypeptides encoded by CC them may be used in the prevention, diagnosis and treatment of diseases CC associated with inappropriate expression of polymorphic polypeptides. For CC example, (I) may be used to treat disproders by rectifying mutations or CC example, (I) may be used to treat disproders by rectifying mutations or CC production in a patient's genome that affect the activity of polypeptides CC by expressing inactive proteins or to supplement the patients own CC production of polypeptide. Additionally, (I) and its complementary CC sequences may also be used as DNA probes in diagnostic assays to detect and quantitate the presence of similar nucleic acids in samples, and CC polypeptides encoded by (I) may be used as antigens in the production of antibodies may be in need of restorative therapy. The CC polypeptides encoded by (I) may be used as antigens in the production of antibodies may also be used to down regulate expression and activity. The antibodies may also be used to down regulate expression and activity. The antibodies may also
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Query Match
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       and quantitate the presence of similar nucleic acids in samples, and therefore which patients may be in need of restorative therapy. The polypeptides encoded by (I) may be used as antigens in the production of antibodies specific for polymorphic polypeptides. The antibodies may also be used to down regulate expression and activity. The antibodies may also be used as diagnostic agents for detecting the presence of polymorphic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Human; single nucleotide polymorphism; SNP; genome; protein therapy; vaccine; probe; diagnostic assay; quantitation; restorative therapy; polymorphic; ds.

                                        CC AAI73060 to AAI79867 represent isolated human polymorphic polynucleotide CC sequences (I), which contain single nucleotide polymorphisms (SNPs). CC AAM53114 to AAM5329 represent peptides related to human polymorphic CC polynucleotide sequences. The sequences can be used in gene and protein therapy, and in vaccine production. (I) and the polypeptides encoded by CC them may be used in the prevention, diagnosis and treatment of diseases CC associated with inappropriate expression of polymorphic polypeptides. For CC deletions in a patient's genome that affect the activity of polypeptides or CC deletions in a patient's genome that affect the patients own CC by expressing inactive proteins or to supplement the patients own CC sequences may also be used as MAN probes in diagnostic assays to detect CC and quantitate the presence of similar nucleic acids in samples, and CC therefore which patients may be in need of restorative therapy. The CC antibodies mapcific for polymorphic polypeptides. The antibodies may also be used as diagnostic agents for detecting the presence of polymorphic polypeptides may also be used as diagnostic agents for detecting the presence of polymorphic polypeptides. The antibodies may also be used as diagnostic agents for detecting the presence of polymorphic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Matches

                                                                                                                                                                                                                                                                                   by expressing inactive proteins or to supplement the patients own production of polypeptide. Additionally, (I) and its complementary sequences may also be used as DNA probes in diagnostic assays to detect and quantitate the presence of similar nucleic acids in samples, and therefore which patients may be in need of restorative therapy. The polypeptides encoded by (I) may be used as antigens in the production of antibodies specific for polymorphic polypeptides. The antibodies may also be used to down regulate expression and activity. The antibodies may also be used as diagnostic agents for detecting the presence of polymorphic polypeptides in samples.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         polynucleotide sequences. The sequences can be used in gene and protein therapy, and in vaccine production. (I) and the polypeptides encoded by them may be used in the prevention, diagnosis and treatment of diseases associated with inappropriate expression of polymorphic polypeptides. For example, (I) may be used to treat disorders by rectifying mutations or deletions in a patient's genome that affect the activity of polypeptides by a procession of polymorphic polypeptides.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              30-NOV-1999; 99US-0168138P

                                                                                                                                                                              CC which contain single nucleotide polymorphisms (SNPs). Sequences 1 to 1112 (C (AAA76318 A77429) are consecutive pairs of nucleotides which contain contain contain to 112 (AAA77630 A77509) are consecutive pairs of nucleotides which contain corresponding amino acid sequences (AAA17430-A77509) are consecutive corresponding amino acid sequences (AAA17430-B1828). The SNPs in CC corresponding amino acid sequences (AAA17430-B1828). The SNPs in CC corresponding amino acid sequences 1129 to 1136 (AAA77446-A77503) result conservative changes. The SNPs in sequences 1187 to 1192 (C (AAA77504-A77503) generate frameshift mutations. The invention also CC changes to a method of detecting a polymorphic site in a nucleic acid and CC a method of determining the relatedness of two nucleic acids. It also CC correspondess peptides containing polymorphic site in a nucleic acid and CC against such peptides containing polymorphic sites, antibodies raised CC gene therapy of an individual having, suspected of having, or at risk of C developing a pathological condition due to the presence of a sequence CC type nucleic acid sequence. Antibodies raised against polymorphic wild-contain acid sequence. Antibodies raised against polymorphic

RESULT 41
AAA77230
CC Sequences AAA76318-A77509 represent 1192 human nucleic acid sequences CC which contain single nucleotide polymorphisms (SNPs). Sequences 1 to 1112 CC (AAA76318-A77429) are consecutive pairs of nucleotides which contain (CC silent SNPs. Sequences 1113 to 1192 (AAA77430-A77509) are consecutive pairs of nucleotides containing SNPs which result in changes in the CC corresponding amino acid sequences (AAB11749-B11828). The SNPs in CC sequences 1113 to 1128 (AAA77430-A77445) lead to conservative amino acid CC changes, while those in sequences 1129 to 1186 (AAA77446-A77503) result (CC in non- conservative changes. The SNPs in sequences 1187 to 1192 (CC (AAA77504-A77509)) generate frameshift mutations. The invention also CC entres to a method of detecting a polymorphic site in a nucleic acid and CC against such peptides containing the relatedness of two nucleic acids. It also CC gene therapy of an individual having, suspected of having, or at risk of CC developing a pathological condition due to the presence of a sequence CC polymorphism. Such treatment would comprise administration of the wild-CC peptides can also be used in the treatment of such individuals
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   AAA77230 standard; cDNA; 51 BP

                                                                                                                                                                                                                                                                                                                                                                                                                                                The present invention relates to oligonucleotides encoding polymorphic variants of proteins related to amylases, amyloid proteins, angiopoietin, apoptosis related proteins, cadherin, cyclin, polymerase, oncogenes, histones, kinases, colony stimulating factors, complement related proteins, cytochromes, kinesins, cytokines, interferons, interleukins, G-protein coupled receptors and thioesterases. The present sequence is one put of a complement of a companion of the peptides encoded by them may be used in the prevention, diagnosis and treatment of diseases associated with inappropriate expression of the proteins listed above. Discrete that may be prevented, diagnosed and/or treated includes that may be prevented, diagnosed and/or treated includes the proteins of the proteins
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Human
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             24-JAN-2002

                                                                                                                                                                                                                                                                                     The present invention relates to oligonucleotides encoding polymorphic cc variants of proteins related to amylases, amyloid proteins, angiopoietin, cc apoptosis related proteins, cadherin, cyclin, polymerase, oncogenes, cc proteins, cytochromes, kinesins, cytokines, interferons, interleukins, cg-cc proteins, cytochromes, kinesins, cytokines, interferons, interleukins, G-cc protein coupled receptors and thioesterases. The present sequence is one cc such oligonucleotide. The oligonucleotides and the peptides encoded by chem may be used in the prevention, diagnosis and treatment of diseases cc associated with inappropriate expression of the proteins listed above. Cc Disorders that may be prevented, diagnosis and treatment of diseases cc diseases (e.g. rheumatoid arthritis, multiple sclerosis, diabetes, cc systemic lupus erythromatosus and Grave's disease), inflammation, cancer (e.g. cancers of the bladder, brain, breast, colon and kidney, crossisms) diseases of the nervous system and an infection of pathogenic corpanisms
                                                                                                                                              밁
                                                                                                                                                                           S
                                                                                                                                                                                                                  Matches
                                                                                                                                                                                                                                                 Query Match
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Immunosuppressive; immunostimulatory; antiinflammatory; cytostatic; neuroprotective; antiinficrobial; gene therapy; vaccine; amylase; cancer; amyloid protein; angiopoletin; apoptosis related protein; cadherin; cyclin; polymerase; oncogene; histone; kinase; colony stimulating factor; complement related protein; cytochrome; kinase; cytokine; interferon; interleukin; G-protein coupled receptor; thioesterase; inflammation; interferon; interleukin; G-protein coupled receptor; thioesterase; inflammation; multifactorial disease; autoimmune disease; infection;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Polymorphic nucleic acids encoding e.g. amylau oncogenes and histones, useful for diagnosing autoimmune diseases and infections.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Human SNP oligonucleotide #3051.

Additionally, (I) and its complementary sequences may also be used as DNA probes in diagnostic assays to detect and quantitate the presence of similar nucleic acids in samples, and therefore which patients may be in need of restorative therapy. The polypeptides encoded by (I) may be used as antigens in the production of antibodies specific for polymorphic polypeptides. The antibodies may also be used to down regulate expression and activity. The antibodies may also be used as diagnostic agents for detecting the presence of polymorphic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     sequences (I), which contain single nucleotide polymorphisms (SNPs).

AAM53114 to AAM5329 represent peptides related to human polymorphic polymucleotide sequences. The sequences can be used in gene and protein therapy, and in vaccine production. (I) and the polypeptides encoded by them may be used in the prevention, diagnosis and treatment of diseases associated with inappropriate expression of polymorphic polypeptides. For example, (I) may be used to treat disorders by rectifying mutations or deletions in a patient's genome that affect the activity of polypeptides
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Sequence 51 BP; 10 A; 19 C; 13 G; 9 T; 0 U; 0 Other;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           AAI73060 to AAI79867 represent isolated human polymorphic polynucleotide sequences (I), which contain single nucleotide polymorphisms (SNPs).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Claim 1; Page 2141; 2653pp; English

```
cc sequences (1), which contain single nucleotide polymorphisms (SNPs).

cc AAM53114 to AAM53329 represent peptides related to human polymorphic cc polynucleotide sequences. The sequences can be used in gene and protein cc therapy, and in vaccine production. (1) and the polymorphic polymorphisms which is a patient's genemate by rectifying mutations or cc example, (1) may be used to treat disorders by rectifying mutations or cdeletions in a patient's genome that affect the activity of polypeptides. For cc by expressing inactive proteins or to supplement the patients own cc production of polypeptide. Additionally, (1) and its complementary cc sequences may also be used as DNA probes in diagnostic assays to detect and quantitate the presence of similar nucleic acids in samples, and ct polypeptides encoded by (1) may be used as antigens in the production of polypeptides of similar nucleic acids in samples, and cc polypeptides encoded by (1) may be used as antigens in the production of antibodies specific for polymorphic polypeptides. The antibodies may also be used as antigens in the production of conventions and capital agents for detecting the presence of polymorphic polypeptides.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Query Match
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       by expressing inactive proteins or to supplement the patients own production of polypeptide. Additionally, (I) and its complementary sequences may also be used as DNA probes in diagnostic assays to detect and quantitate the presence of similar nucleic acids in samples, and therefore which patients may be in need of restorative therapy. The polypeptides encoded by (I) may be used as antigens in the production of antibodies specific for polymorphic polypeptides. The antibodies may also be used to down regulate expression and activity. The antibodies may also be used as diagnostic agents for detecting the presence of polymorphic polypeptides in samples
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               AAI73060 to AAI79867 represent isolated human polymorphic polynucleotide sequences (I), which contain single nucleotide polymorphisms (SNPB). AAM53114 to AAM53129 represent peptides related to human polymorphic polynucleotide sequences. The sequences can be used in gene and protein therapy, and in vaccine production. (I) and the polypeptides encoded by them may be used in the prevention, diagnosis and treatment of diseases associated with inappropriate expression of polymorphic polypeptides. For example, (I) may be used to treat disorders by rectifying mutations or deletions in a patient's genome that affect the activity of polypeptides
                                                         Isolated human polynucleotides containing single nucleotide polymorphisms, useful for the treatment and diagnosis of e.g. cancer.
                                                                                                          P-PSDB;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present invention relates to human nucleic acids containing single nucleotide polymorphisms (SNPs). These can be used in forensic and paternity tests, and to aid in the treatment of disease associated with aberrant protein expression, including cancer, amyloidosis, diabetes, altheimer's disease, Down's syndrome, oedema, thrombocytopaenia, arthritis, glomerulonephritis, haemolytic anaemia, thrombocytopaenia, arthritis, menningitis, muscular disorders, dementia, neurological diseases, tuberous
                                              The present invention relates to human nucleic acids containing single nucleotide polymorphisms (SNPs). These can be used in forensic and paternity tests, and to aid in the treatment of diseases associated with aberrant protein expression, including cancer, amyloidosis, diabettes, Alzheimer's disease, Down's syndrome, oedema, lupus (SLE), vasculitis, glomerulonephritis, haemolytic anaemia, thrombocytopaenia, arthritis, meningitis, muscular disorders, dementia, neurological diseases, tuberous sclerosis, male infertility, hypercalcaemia, blood pressure disorders, osteoporosis, pathogenic infections, hypercholesterolaemia, obesity or autoimmunity. The present sequence is a polymorphism-containing
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           meningitis, muscular disorders, dementia, neurological diseases, tuberous sclerosis, male infertility, hypercalcaemia, blood pressure disorders, osteoporosis, pathogenic infections, hypercholesterolaemia, obesity or autoimmunity. The present sequence is a polymorphism-containing
                                                                                                                                                                                                                                                               Isolated human polynucleotides containing single nucleotide polymorphisms, useful for the treatment and diagnosis of e. infection and diabetes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Human coding
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                AAH89406 standard;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Sequence 51
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               oligonucleotide fragment of the invention

                                                                                                                                                   CC comprising one or more single nucleotide polymorphisms (SNPS). ABB56531
CC to ABB56903 represent human peptides encoded by some of the SNP
CC oligonucleotides. The sequences from the present invention can have
immunosuppressive, cytostatic, antiinflammatory, neuroprotective and
cc antimicrobial activities. Nucleic acids, polypeptides, oligonucleotides
cc and antibodies from the present invention can be used for treating a
cc subject suffering from, at risk for, or suspected of, suffering from a
cc pathology ascribed to the presence of a sequence polymorphism. The
cc pathology may be autoimmune diseases, inflammation, cancer, diseases of
cc the nervous system, and infection by pathogenic microorganisms. The
cc polymorphism are present in individuals. The antibodies may be used in
cc polymorphism are present in individuals. The antibodies may be used in
cc polymorphic protein (e.g., for use in measuring levels of the polymorphic
cc protein within appropriate physiological samples)
